                                     associated proteins (I) and the nucleic acids (NAs) that encode them.
(I) have cytostatic activity and can be used in gene therapy, antisense inhibition and in vaccines. The NAs and the lung tumour-associated proteins they encode may be used in the prevention, treatment and diagnosis of diseases associated with their inappropriate expression, especially lung cancers. For example, the NAs may be administered to treat diseases by rectifying mutations or deletions in a patient's genome that affect the activity of the protein by expressing inactive proteins or to supplement the patients own production of (I). Additionally, the NAS may be used to produce the lung-tumour associated protein, according to standard recombinant DNA methodology. Conversely, antisense NA molecules may be administered to down recombinate protein by expression by
                                                                                                                                                                                                                                                                                                                                                   Wang
molecules may be administered to down regulate protein expression by binding with the cells own genes and preventing their expression. The and complementary sequences may also be used as DNA probes in diagno

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     assays to detect and quantitate the presence of similar NA sequences in samples, and hence which patients may be in need of treatment for lung cancer. The (I) may be used as antigens in the production of antibodies and in assays to identify modulators (agonists and antagonists) of the expression and activity of the protein. AAF68083 to AAF68878 and AAB76878 represent human lung tumour protein related nucleotide and protein sequences which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human cancer associated protein sequence SEQ ID NO:1292

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cc include: cytostatic; proliferative; vulnerary; immunomodulator; antidiabetic; antiasthmatic; antisheumatic; antiarthritic; cantinflammatory; antithyroid; antiallergic; antibacterial; antiviral; cc antinflammatory; antithyroid; antiallergic; antibacterial; antiviral; cc nootropic; vasotropic; antipsoriatic and antianglogenic. The polynucleotides and polypeptides can be used for preventing, treating or meliorating medical conditions and diagnosing pathological conditions. Cc polynucleotides, polypeptides, antibodies, agonists and antagonists from cc present invention may be used to treat immune disorders by activating the proliferation, differentiation or mobilisation of immune cells, to treat disorders of haematopoietic cells, autoimmune clisquic reactions, graft versus host disease and organ rejection, modulate haemostatic or thrombolytic activity, modulate nacers, cardiovascular disorders, neurological disease and caponists and antagonists may be also be used in drug screens. AAC78449 to AAC78457 and AAB44240 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches

The novel isolated RGS-GEF polypeptide consists of CC an RGS domain of a GEF protein and does not comprise a dbh homology (DH) CC domain or a pleckstrin homology (PH) domain. The RGS-GEF polypeptides CC (an be used for modulating an activity of a G protein alpha subunit CC (GAS). The products can be used for the regulation of biological pathways CC in which a RGS-GEF polypeptide is involved, particularly pathological CC conditions, e.g. cell proliferation (e.g. cancer), morphogenesis, growth CC control, stress fiber formation, and integrin-mediated interactions, CC such as embryonic development, tumor cell growth and metastasis, cc programmed cell death, hemostasis, leukocyte homing and activation, bone CC regions of transgenic animals. Sequences AAY41014-028 represent RGS CC regions of several proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

The encoding gene sequence was isolated from a rat brain cDNA library by phage plaque hybridisation using the probes AaAv19206 and AAV19207, followed by primer extension. The screening isolated a product of 545 bp. The 5' and 3' ends of the coding sequence were then obtained by RACE amplification resulting in the isolation of the 875 bp rat p26 cDNA clone. p26 protein is useful as a reagent for screening for compounds having dephosphorylase inhibitory activity. It is also useful as a treating and preventive agent for diseases related to the haematogenic system.

MOL. Cell. Biol. 18:2867-2875(1998).

-i- FUNCTION: INHIBITOR OF THE WNT SIGNALING PATHWAY. DOWN REGULATES BETA-CATENIN. PROBABLY FACILITATE THE PHOSPHORYLATION OF BETA-CATENIN AND APC BY GSK-3B (BY SIMILARITY).

-i- SUBUNIT: INTERACTS WITH GLYCOGEN SYNTHASE KINASE-3 BETA (GSK-3B) AND BETA-CATENIN. THE INTERACTION BETWEEN AXIN AND BETA-CATENIN.

OCCURS VIA THE ARMADILLO REPEATS CONTAINED IN BETA-CATENIN.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       BETA-CATENIN. PROBABLY FACILITATE THE PHOSPHORYLATION OF BETA-CATENIN AND APC BY GSK-3B (BY SIMILARITY).

1. SUBUNIT: INTERACTS WITH GSK-3B AND BETA-CATENIN. THE INTERACTION BETWEEN AXIN AND BETA-CATENIN OCCURS VIA THE ARMADILLO REPEATS COMTAINED IN BETA-CATENIN, TERNARY COMPLEX. ALSO BINDS TO PLAKOGLOBIN (GAMMA-CATENIN), APC, DVL AND PP2A (BY SIMILARITY).

1. SUBCELLULAR LOCATION: CYTOPLASMIC (BY SIMILARITY).

1. ALTERNATIVE PRODUCTS: 2 ISOFORMS; 1 (SHOWN HERE) AND 2; ARE PRODUCED BY ALTERNATIVE SPLICING.

1. TISSUE SPECIFICITY: EXPRESSED IN EMBRYONIC STEM CELLS.

1. TISSUE SPECIFICITY: EXPRESSED IN EMBRYONIC STEM CELLS.

1. DEVELOPMENTAL STAGE: WIDELY EXPRESSED AT E10.5 TO E16.5 DAY.

1. PTM: PROBABLY PHOSPHORYLATED BY GSK-3B AND DEPHOSPHORYLATED BY PP2A.

1. SIMILARITY: CONTAINS 1 RGS DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Pfam;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       HSSP; P49799; 1AGR.

Dev. 80:147-151(1999).

FUNCTION: INHIBITOR OF THE WNT SIGNALING PATHWAY. DOWN REGULATE BETA-CATENIN. PROBABLY FACILITATE THE PHOSPHORYLATION OF BETA-CATENIN AND APC BY GSK-3B (BY SIMILARITY).

CATENIN AND APC BY GSK-3B (BY SIMILARITY).

SUBCELLULAR LOCATION. CYTOPLASMIC (BY SIMILARITY).

DEVELOPMENTAL STAGE: WEAKLY AND UBJOITOUGLY EXPRESSED THROUGHC EARLY DEVELOPMENT, AND HIGHLY EXPRESSED IN THE ANTERIOR MESENCEPHALON ADJACENT TO THE FOREBRAIN-MIDBRAIN BOUNDARY.

PTM: PROBABLY PHOSPHORYLATED BY GSK-3B AND DEPHOSPHORYLATED BY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          s SWISS-PROT entry is copyright. SUBUNIT: INTERACTS WITH GLYCOGEN SYNTHASE KINASE-3 BETA (GSK-3B)
AND BETA-CATENIN. THE INTERACTION BETWEEN AXIN AND BETA-CATENIN
OCCURS VIA THE ARMADILLO REPEATS CONTAINED IN BETA-CATENIN.
TERNARY COMPLEX. MAY ALSO BINDS TO PLAKOGLOBIN (GAMMA-CATENIN),
APC, DVL AND PP2A.
SUBCELLULAR LOCATION: CYTOPLASMIC.
TISSUE SPECIFICITY: UBIQUITOUSLY EXPRESSED.
PTM: PROBABLY PHOSPHORYLATED BY GSK-3B AND DEPHOSPHORYLATED BY
                                                                                                                                                                                                                                                                                                                                                                       SIMILARITY: CONTAINS 1 RGS DOMAIN. SIMILARITY: CONTAINS 1 DIX DOMAIN.
